

MotionWindow

The future of advertising is here...now.

MotionWindow is a revolutionary way to reach your audience.

Through our futuristic LED technology, we can bring the power of movement to your window graphics.

MotionWindow is a highly visible way to attract an audience to any retail or trade show environment. If you place a standard TV screen in a window display it looks blacked out and cannot be viewed from across the street. This is because a standard LCD TV emits approximately 1000 nits of light where as daylight is typically 5000 nits. MotionWindow runs at between 4000 and 6000 Nits making it as bright or brighter than daylight. Therefore it is highly visible during the day and exceptionally bright in the evenings. This makes your advertising the brightest and most visible point in the street both day and night.

MotionWindow is easy to update, either through a connected PC or remotely through a network connection. Change your campaign at any speed you need to, on site or across the country.

MotionWindow is 80% transparent. Unlike traditional televisions or flat screens, MotionWindow will allow visibility into the store without diminishing its power of projection.

MotionWindow comes in standardized stand alone units or full customizable modules to be fitted to any window. There is a solution for every situation.

The future is now with MotionWindow. Bring your windows to life.
